

### 37. DataFrame from Dictionary Question

Write a Pandas program to create a dataframe from a dictionary and display it.

#### Aim

To create and display a DataFrame from a dictionary using Pandas.

**Code** import pandas as pd data = {

'Name': ['John', 'Alice', 'Bob'],

'Age': [20, 21, 22],

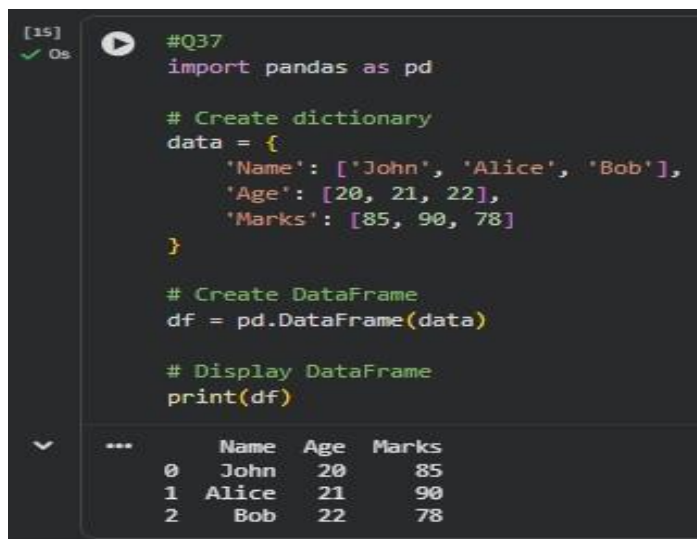

'Marks': [85, 90, 78]

}

df = pd.DataFrame(data)

# Display DataFrame

print(df) **Output:**

```
[15] #Q37
import pandas as pd

# Create dictionary
data = {
    'Name': ['John', 'Alice', 'Bob'],
    'Age': [20, 21, 22],
    'Marks': [85, 90, 78]
}

# Create DataFrame
df = pd.DataFrame(data)

# Display DataFrame
print(df)
```

|   | Name  | Age | Marks |
|---|-------|-----|-------|
| 0 | John  | 20  | 85    |
| 1 | Alice | 21  | 90    |
| 2 | Bob   | 22  | 78    |

### 38. DataFrame with Index Labels Question

Write a Pandas program to create and display a DataFrame from a specified dictionary data which has the index labels.

#### Aim

To create and display a DataFrame from dictionary data with specified index labels.

**Code** import pandas as pd

# Create dictionary data

= {

'Name': ['John', 'Alice', 'Bob'],

```
'Score': [85, 90, 78],  
'Age': [20, 21, 22]  
}
```

```
# Create DataFrame with index labels df = pd.DataFrame(data,  
index=['Student1', 'Student2', 'Student3'])
```

```
# Display DataFrame
```

```
print(df) Output:
```

```
[16] #Q38  
✓ Os import pandas as pd  
  
# Create dictionary  
data = {  
    'Name': ['John', 'Alice', 'Bob'],  
    'Score': [85, 90, 78],  
    'Age': [20, 21, 22]  
}  
  
# Create DataFrame with index labels  
df = pd.DataFrame(data, index=['Student1', 'Student2', 'Student3'])  
  
# Display DataFrame  
print(df)
```

|          | Name  | Score | Age |
|----------|-------|-------|-----|
| Student1 | John  | 85    | 20  |
| Student2 | Alice | 90    | 21  |
| Student3 | Bob   | 78    | 22  |
